
EVER NEEDED TO GET BACK AN IMPORTANT EMAIL THAT GOT DELETED?

The Backup Systems Server can already backup your Microsoft Exchange server as a whole but restoring an Exchange server just to retrieve a single email from a couple of months ago can be a real headache.

Exchange server performance degrades as the message store increases in size. Having a system in place enabling you to purge but still having access to old emails quickly, is vital.

Backup Systems Email Archiving overcomes these problems. Individual emails can now be retrieved even if they were deleted many months or years ago.

Emails can be retrieved using a simple interface, which also allows advanced searches. In seconds the email can be opened with Microsoft Outlook and put back into a user's inbox if required.

The Backup Systems Server holds emails locally and replicates them to the cloud or to a secondary site. Emails can be accessed from the server's web-portal and because they are exact replicas of the original email you can be sure legal requirements are satisfied.

TECHNICAL SUMMARY

- Connects to Microsoft Exchange 2003, 2007 and 2010
- Select which mailboxes to backup
- Backs up individual emails
- Stored on a dedicated backup appliance
- Locate and retrieve emails in seconds
- Emails retrieved in native Microsoft (msg file) format – includes all attachments
- Compatible with Microsoft Outlook
- Stored onsite and replicated for disaster recovery
- Reduces Exchange store size – improving server performance
