
NEED TO BACK UP LAPTOPS NOT ON THE COMPANY NETWORK?

Organisations often have employees working on laptops which are off the company network for significant periods of time. Travelling sales people often produce Word and Excel files while on-the-road.

The data on these laptops can be critical and needs to be backed up like any other file on the company network.

To address the situation where a laptop (or any computer) not connected to the company network needs to be backed up, Backup Systems have developed a solution which runs on the laptop, backing up files in selected areas whenever the laptop connects to the internet.

The system backs up files directly to your onsite Backup Server. The files are stored alongside the organisation's data and can be accessed in the same way. The data will then be replicated to the cloud or to a secondary site.

The system is fully customisable so you can select which directories and file types are to be included in the backup and how often the backup should occur.

We understand that while on the road, the internet connection available may not be the best, so the system will only send the changes that have happened to each file. There is also a safeguard 'throttle' to make sure the backup doesn't use more of the available connection than you are happy to spare.

TECHNICAL SUMMARY

- Backs up files at user defined frequency
- Uses Microsoft Volume Shadow Service to safely backup locked files
- Optimised data transfer – minimises bandwidth usage by only transmitting changes to files
- Auto detects internet settings – works via proxy or direct connection
- Data encrypted while in transmission, laptop authentication using secure keys
- Supports all versions of Microsoft Windows
